

3. The Python list stores a collection of objects in an ordered sequence. In contrast, the dictionary stores objects in an unordered collection. Give three examples of real-world objects that can be stored in a dictionary.

An address book that stores the person's name as the key while the email address is the value.

An inventory counter each item would be stored as the key and the quantity of each item would be the value.

A database that stores prices (values) **for items** (keys) **An address book that stores** the person's name as the key while the email address is the value.
